

Urban Retail Co. – Executive Summary_(2022–2023)

This project focuses on inventory optimization and forecasting using real-world retail sales data. The goal is to design an efficient database schema, load and transform structured data, and generate insights to improve stock management. Using MySQL, we built a relational model including dimension and fact tables that capture product, store, calendar, pricing, and inventory details. Advanced SQL queries were used to analyze low stock levels, estimate reorder points, calculate turnover ratios, and evaluate overall inventory health. These insights will help decision-makers ensure product availability while minimizing overstock costs.
